## 1. Introduction

### 1.1 Purpose of This Document

This document provides a description of The Redistrictinator user interface at different levels. The main purpose is to provide all the necessary knowledge for the development web-based application. The concepts and techniques exposed in this document shall be carefully applied in the development, in order to obtain optimal districting software. Future changes in development should result in changes in this document.

## 2. User Interface Standards

The application will mainly adapt to tables, forms, variables, and other developer products. We shall use various techniques for navigation, including switchboards, command buttons on forms, and drop-down menus. A standard method for laying out and presenting information on forms, including methods of navigating between various parts of the form, standard colors for forms, and some of the basic functionality should be built into all forms. A standard design and layout for all reports will ensure uniformity. This could include dates and system logs about exactly what is going on. We need standards around the documentation we'd produce, both for systems and user documentation. However, we need to develop a standard for user documentation including the use of screen captures and various features used in creating this documentation.

## 3. User Interface Walkthrough

- 1) Mouse over state to view general state data
- 2) Zoom in on specified state to view specific state district data
- 3) Same as 2
- 4) Zoom back out to whole country view

#### 4. Data Validation

All required data will be retrieved from Google Fusion Tables containing all of the ZIP codes in the U.S. and their boundaries. The user will not have to enter any data. The algorithm will take a type of census data and use that to redistrict a selected state. Each time the redistrict button is clicked the algorithm should run again based on selected census data. Google maps will display the results of state along with information such as demographics, district number, and population. The application will have its most functional aspect underneath minus data choice if it is specified in the settings tab.

#### 5. Report Formats

This product does not generate any hard copy reports that are not described in the User Interface Walkthrough.

## Appendix A – Agreement Between Customer and Contractor

The system to be implemented will be a web app that displays 8 districts in Maryland that have been redistricted to create evenly populated districts. The user interface specifications and requirements are accurate and determine the guidelines of this system. Bricks and the customer, Geoff Weiss, all agree to the terms provided in this document.

If a change to this document is necessary, the following procedure will be used. The edit to the document will first be discussed in the biweekly meetings. If agreed upon by both parties, the new document will be drafted by the development team, Team 17. Once completed, the finished document will be sent to the customer to be resigned and then resubmitted to the github account.
